Automating multilingual video creation for training and incident reporting, at scale

Sthiros built an AI-driven video generation solution turning incident logs, SOPs, and training scripts into short, multilingual videos, replacing weeks of manual production with a structured, scalable workflow.

Client	Service	Use Cases	Geography
Cross Industry – Mining, Manufacturing, Infrastructure Energy, Services	**AI-Driven Multilingual Video Generation, Training & Incident Communication**	**Incident Reporting, SOP Explanation, Workforce Training**	**South Africa**

The Challenge:

When training and incident videos take weeks to reach the workforce

Organisations relying on manual video production for training, incident reporting, and technical communication faced slow cycles, heavy stakeholder dependency, and limited ability to scale content across languages, exactly when speed and consistency mattered most.

Manual Video Production Taking Weeks

Manual video production cycles for training and incident reporting content routinely took weeks to complete.

Dependency on Multiple Stakeholders

Every video depended on coordination across script, design, voice, and editing teams, each a potential bottleneck.

Inconsistent Quality & No Standard Templates

With no standardised templates, maintaining consistent quality and branding across videos was difficult to sustain at scale.

Limited Multilingual Capability

Producing content in multiple languages for distributed, multilingual workforces was difficult to scale using manual processes.

Delays in Critical Communication

Slow production cycles delayed the communication of time-sensitive incident and training information.

The Solution:

A structured, AI-powered video generation workflow

Sthiros implemented a structured, AI-powered video generation workflow, moving organisations from manual, resource-heavy production to a scalable automation model built for business use.

Structured inputs now flow through AI storyboarding, multilingual voice generation, automated production, and secure delivery, with standardised templates keeping quality and branding consistent across every video.

The Methodology

1 AI Storyboard & Script Engine

Structured inputs, incident logs, SOPs, and scripts, converted into video-ready storyboards with scene breakdowns, visual cues, subtitles, and a standardised narrative flow.

2 Multilingual Voice & Audio Layer

Voiceovers generated using neural text-to-speech, supporting multiple languages per video while maintaining consistent tone and clarity.

3 Automated Video Production Workflow

Visuals, voiceovers, and subtitles combined into short-format videos with built-in revision cycles for minor edits and improvements.

4 Delivery & Management Layer

Final MP4, audio, and script files delivered through a secure repository with version control and usage tracking.

What This Means

Cut weeks down to days.

Four languages, one message.

Multiple videos, one standard

Outcomes

5 Days

Draft turnaround

From structured input to a first video draft.

20 Days

End-to-end production

From initial input through to final delivered video.

10-50

Videos per batch

Produced at once using standardised, repeatable templates.

4 Languages

Supported per video

Consistent messaging maintained across every language variation.

Get in touch

Is your training content scalable, or just repeatable by hand?
