# Cutting manual cash burn reporting effort by 50-70%, in 25 business days

An e-commerce and supply chain platform engaged Sthiros to automate its cash burn reporting, replacing manual bank statement processing with a structured Microsoft-based reporting framework.

| Client | Service | Sector | Geography |
|---|---|---|---|
| **An Organisation in the E-Commerce & Supply Chain Platform Space** | **Automated Cash Burn Reporting, Microsoft Ecosystem** | **E-Commerce, Supply Chain Platform** | **India** |

## The Challenge:

### When cash burn insight depends on manual reconciliation

This finance team relied on multiple data sources, bank statements, ERP systems, and internal files, leading to manual effort, delays, and inconsistencies in cash burn reporting across the organisation.

#### Manual Processing of Bank Statements

Bank statements across multiple accounts were processed manually, creating effort and inconsistency at the source.

#### No Standardised Transaction Classification

Without standardised classification logic, transactions were mapped to business units and categories inconsistently.

#### Time-Consuming, Delayed Reporting Cycles

Report preparation was slow, delaying accurate cash burn insights when finance teams needed them most.

#### Dependency on Multiple Disconnected Sources

Bank data, ERP, and HR inputs sat in separate systems, with no unified process to bring them together.

#### Limited Flexibility for Corrections

Automated classification offered little room for manual correction where edge cases required judgement.

#### Difficulty Integrating Actuals with Forecasts

Actual cash burn data and forecast data lived apart, with no structured process connecting the two.

## The Solution:

### An end-to-end automation solution, built within Microsoft

Sthiros implemented an end-to-end automation solution inside the Microsoft ecosystem, structuring bank data, standardising transaction classification, and generating cash burn reports automatically.

Forecasting was built directly into the same framework, with HR and ERP data integrated so actuals and forecasts finally lived in one connected model.

## The Methodology

1

### Data Structuring & Processing Layer

Bank statement data extracted and structured from multiple banks and formats, preparing it for downstream analysis and reporting.

2

### Transaction Mapping & Classification

Rule-based logic mapping transactions to business units and expense categories, with flexibility for manual overrides where needed.

3

### Automated Reporting Engine

Multiple cash burn reports generated automatically, Actual, Steady-State Operational, and Imputed Cash Burn with EBITDA reconciliation, in standardised formats.

4

### Forecasting Enablement

HR inputs and ERP data, including SAP B1, integrated to build a structured process for forecasted cash burn reporting.

5

### Microsoft-Based Data & Reporting Architecture

Excel, CSV, SQL, and ERP sources processed through Power Automate and SQL, visualised in Power BI, and collaborated on via SharePoint and

## What This Means

**One dataset, three reports.** | **Visibility in 25 days.** | **Automate the maths, keep judgement.**

## Outcomes

50-70%

**Reduction in manual processing effort**

Across bank statement handling, transaction classification, and report consolidation.

25 Days

**Implementation timeline**

From data structuring through to a live, automated reporting engine.

3

**Cash burn report types automated**

Actual, Steady-State Operational, and Imputed Cash Burn with EBITDA reconciliation.

3

**Data sources unified**

Bank statements, ERP (SAP B1), and HR data brought into one reporting model.

## Get in touch

**Is your cash burn reporting automated, or just assembled?**
