Fixing discharge delays, radiology waits, and seven other symptoms, one hospital system at a time

A leading multi-specialty healthcare provider engaged Sthiros for an 18 to 24 month operations excellence programme, addressing 9 critical improvement areas.

Client	Service	Sector	Geography
Leading Multi-Specialty Provider	**Healthcare Operations Excellence & Process Optimisation**	**Healthcare, Hospital Ops**	**Global, Multi-Location**

The Challenge:

When every fix treats an outcome, not a cause

This hospital network faced extended discharge times, long radiology waits, reactive equipment maintenance, and supply chain blind spots. Prescription errors and manual admin work compounded the risk, spanning clinical and non-clinical operations alike.

Extended Discharge TAT
Discharge delays affected bed availability and patient satisfaction.

Long Radiology Wait Times
No capacity visibility left CT and MRI scheduling reactive, not planned.

Reactive Maintenance Costs
No preventive protocol existed, so equipment breakdowns drove repair costs up.

Supply Chain Blind Spots
Dead stock and stock-outs sat side by side across wards and pharmacy.

Patient Safety Errors
Prescription and transcription errors lacked a structured error-proofing protocol.

Manual Admin Burden
File management, onboarding, and contact centre work ran on manual process.

The Solution:

Nine symptoms, one structured programme

Sthiros ran a comprehensive operations excellence programme addressing nine improvement areas with tailored solutions, spanning discharge, clinical quality, supply chain, and administrative functions.

Every intervention was tracked against clinical quality benchmarks, governed to HIPAA and JCI standards throughout the transformation.

The Methodology

1 Discharge TAT Time Reduction

Value stream mapping and parallel processing of medication, billing, and documentation cut variability from discharge order to patient exit.

2 5S Implementation & Patient Care

5S methodology and visual management across clinical and support areas reduced search time and improved infection control.

3 Quality Metrics Improvement (TKR)

Standardised surgical protocols and physician feedback loops brought Total Knee Replacement quality to international benchmarks.

4 Mover / Transporter Optimisation

Demand pattern analysis and priority-based dispatch reduced patient transfer delays and improved care continuity.

5 Pharmacy Supply Chain Optimisation

ABC-XYZ inventory segmentation and reorder level optimisation cut dead stock and prevented stock-outs.

6 Prescription & Transcription Errors

Root cause analysis and double-check protocols for high-risk medications reduced patient safety errors.

7 Ambulance & Contact Centre

GPS-tracked dispatch and contact centre workflow redesign cut emergency response and query resolution times.

8 Patient Sentiment Analysis

NLP-based sentiment analysis on patient feedback flagged at-risk experiences before they became formal complaints.

9 Email Automation

NLP-based filtering and automated routing cut delays on critical patient and physician communications.

What This Means

Discharge faster, free the bed.

Standardise the surgery, hit the benchmark.

Patient sentiment becomes a signal, not a guess.

Outcomes

9

Improvement areas addressed

Spanning clinical, operational, supply chain, and administrative functions.

18-24

Month transformation

A phased programme covering the full hospital operations ecosystem.

International

TKR benchmark reached

Unilateral Total Knee Replacement quality metrics met global standards.

Zero-Defect

Maintenance checklists

Preventive protocols replacing reactive equipment repair and breakdown.
