Finding 3,420 discrepancies inside 1.17 crore units, then closing every one of them

A global glass manufacturer engaged Sthiros for a structured physical inventory verification, uncovering 3,420 discrepancies across Stores, Logistics, and two glass divisions.

Client	Service	Sector	Geography
Global Glass Manufacturer, India	**Structured Physical Inventory Verification**	**Manufacturing, Auto Glass**	**India**

The Challenge:

When constant movement outpaces system accuracy

This glass manufacturer's inventory spanned Stores, Logistics, Tempered, and Laminated divisions, thousands of line items tracked in the LAMA system. Continuous production consumption, dispatches, and repacking made real-time stock alignment difficult to hold.

High-Volume Multi-Location Stock
Thousands of line items spread across Stores, Logistics, and two glass divisions.

System Dependency Risk
LAMA records needed accurate mapping against physical reality, not assumed accuracy.

Continuous Operational Movement
Production consumption, dispatches, and repacking shifted stock in real time.

Labelling & ID Gaps
Weak identification controls left tracking inconsistencies across locations.

Repacking Traceability Gaps
Repacked items carried label and rack IDs that no longer matched LAMA records.

Ownership Ambiguity
Responsibility across Stores, Logistics, and Production needed formal mapping.

The Solution:

A structured three-phase verification, closed out with full reconciliation

Sthiros ran a structured physical verification across every location, matching physical stock against LAMA records line by line and classifying every gap by cause, not just by count.

Every mismatch was then re-tagged, corrected, and updated in the LAMA system, restoring full traceability across the inventory environment.

The Methodology

1

Data Validation & Preparation

Stock-in-Hand extracted from LAMA, with stock descriptions and line item accuracy verified before finalising the inventory universe for verification.

2

Ownership & Control Mapping

Responsibility established across departments, with confirmations obtained from Stores, Logistics, and Production teams before counting began.

3

Physical Verification Execution

Field-level verification conducted across every location, matching physical stock against LAMA records and identifying label and tracking inconsistencies.

What This Means

Labels lie more than stock counts.

Reconcile system against shop floor.

Traceability starts at the tag.

Outcomes

3,420

Discrepancies identified

Labelling, tracking, and repacking mismatches surfaced across every location.

30

Man-days deployed

A structured, field-level verification across Stores, Logistics, and Production.

1.17 Cr+

Units verified in Stores alone

Physical stock matched line by line against LAMA system records.

100%

Reconciliation completed

Every mismatch re-tagged, corrected, and updated in the LAMA system.
