Turning 10+ disconnected systems into one 'Eye' for 10,000+ users to see by

A leading construction and infrastructure enterprise engaged Sthiros to build 'Eye', a centralised analytics platform giving the CFO and leadership one unified, real-time view across every project.

Client	Service	Sector	Geography
Leading Construction & Infrastructure Enterprise	**Unified Analytics Platform & KPI Governance**	**Construction & Infrastructure**	**India**

The Challenge:

When 10,000+ users generate data no single view can see

This construction enterprise ran independent systems for attendance, procurement, project progress, safety and quality checks, equipment and IoT data, and a custom ERP for finance. Each system worked well individually, but with no integration between them, leadership had no organisation-level visibility into its own operations.

No Single Dashboard for Leadership

No organisation-level view existed for leadership and the CFO, with critical information scattered across applications and ERP modules.

Manual MIS Consolidation

Purchase modules and other ERP components required manual consolidation into MIS reports every cycle.

Multiple Hierarchy Layers

Data had to pass through multiple organisational layers between project execution teams and executives.

Difficulty Tracking Project Status

Tracking project status at both organisation and programme level was slow and inconsistent.

Limited KPI Drill-Down

Leadership had limited ability to drill down from high-level KPIs to project-specific insights.

Growing Operational Risk

Budget approval delays, compliance gaps, quality failures, and project overruns grew as the portfolio scaled.

The Solution:

A five-part platform, built around 200+ KPIs

Sthiros designed 'Eye', a centralised analytics platform consolidating every ERP and non-ERP data source into a single source of truth, with over 200 KPIs finalised across financial, safety, quality, workforce, and compliance domains.

Organisation-level dashboards now drill down into business groups and individual projects, with role-based access ensuring every user sees exactly what their responsibility requires.

The Methodology

1

Systems Integration Layer

ERP purchase modules and other operational systems integrated into a single analytical layer, replacing manual consolidation with one connected data flow.

2

Organisation-Level Dashboards

Dashboards built with the ability to drill down from organisation level into business groups and individual projects.

3

Programme-Level Views

Views designed to monitor multiple projects simultaneously, giving leadership a programme-wide lens alongside project-level detail.

4

Role-Based Access Control

Data visibility aligned to user responsibility, ensuring the right information reached the right level of the organisation.

5

Denormalised Reporting Structure

A denormalised structure built to handle high-volume KPI consumption efficiently across 10,000+ users.

What This Means

One dashboard replaces a dozen logins.

Drill from portfolio to project in a click.

Reporting time drops by 60%.

Outcomes

60%

Reduction in response & reporting time

Across financial and operational reporting cycles.

200+

KPIs tracked

Standardised across financial, safety, quality, workforce, and compliance domains.

150+

Dashboards developed

Supporting drill-down from organisation level to individual projects.

1000+

Active application users

Across 10+ ICs, replacing dependency on individuals with dependency on systems.
