Automating 11+ SAP-dependent processes down to a 5-minute execution cycle

A leading heavy equipment and industrial distribution organisation engaged Sthiros to transform its manual, SAP-dependent processes into a fully automated, audit-ready digital ecosystem.

Client	Service	Sector	Geography
A Leading Heavy Equipment & Industrial Distribution Organisation	**SAP-Integrated Automation & Power Platform Enterprise Transformation**	**Heavy Equipment, Industrial Distribution**	**India**

The Challenge:

When SAP runs the business, but people still run SAP

This organisation relied heavily on manual data entry into SAP, Excel-based tracking, and fragmented workflows, leading to inefficiencies, delays in financial closure, and limited process visibility across finance, sales, and fixed assets.

Manual SAP Entry & Excel Dependency
Manual SAP data entry across finance, sales, and fixed assets ran alongside heavy dependency on Excel and offline tracking.

Lack of Standardised Workflows
No standardised workflows or approval mechanisms existed across departments.

No Audit Trail or Transaction Visibility
No centralised audit trail or error tracking existed, leaving limited visibility into transaction status and failures.

Delays in Month-End Closure
Month-end closure and reporting cycles ran slower than the business needed, compounded by manual reconciliation.

Rigid, Disconnected SAP Landscape
Complex SAP processes offered no flexibility for customisation, while systems across departments remained disconnected from each other.

Inefficient CAPEX & Fixed Asset Tracking
Fixed asset lifecycle tracking, from procurement through to disposal, ran without a structured, end-to-end process.

The Solution:

A full-stack automation engine, built around SAP without customising it

Sthiros implemented a full-stack enterprise automation solution combining Power Platform, Python-based SAP automation, and centralised data architecture, replacing manual entry and Excel tracking across every core function.

SAP posting, validation, and error handling now run on a near real-time schedule, with every transaction, error, and approval logged for full audit readiness.

The Methodology

1 Digitisation Layer, Power Apps

Power Apps built for every business process, finance, sales, fixed assets, and inventory, replacing Excel with structured data capture and CAPEX approval workflows.

2 Workflow Automation, Power Automate

End-to-end orchestration built for approval routing, escalations, reminders, and trigger-based process execution across departments.

3 SAP Integration Layer, Python-Based Automation

A custom Python engine automating SAP posting and status retrieval, with success and failure transactions logged and error alerts triggered automatically.

4 Data & Integration Layer

SQL established as the single source of truth, with ADF pipelines extracting SAP data and synchronising Power Apps, Python bots, SAP ECC, and SharePoint.

5 RPA & Execution Layer

Python automation as the primary execution engine, combined with Power Automate Desktop, fully automating SAP data entry and extraction without system modification.

6 Analytics & Reporting

Power BI dashboards built for process status, financial KPIs, and audit monitoring, giving real-time insight into transaction success and workflow bottlenecks.

What This Means

SAP entries post without hands.

Every failure logs itself.

Month-end closes faster, always.

Outcomes

60-80%

Reduction in manual effort

Across SAP entry, workflow delays, and processing cycles.

11+

Business processes automated

Spanning finance, sales, inventory, and fixed assets end-to-end.

100%

Digital audit trail

Every transaction, error, and approval centrally logged.

Every 5 Min

Automated SAP processing cycle

Near real-time posting, validation, and error handling via scheduled execution.
