Turning 200+ hours of manual airline work each month into real-time automation

A leading travel technology platform engaged Sthiros to modernise its data, finance, and airline operations, combining data engineering, automation bots, and real-time analytics.

Client	Service	Sector	Geography
Leading Travel Technology Platform	**Data Engineering, Automation & BI Transformation**	**Travel & Tourism, Travel Tech**	**India**

The Challenge:

When manual airline operations cap what the platform can scale

This platform operated across multiple airlines, booking systems, ERP integrations, and financial datasets, but manual processes, fragmented systems, and a lack of real-time monitoring were holding back operational efficiency, financial accuracy, and customer experience.

No Unified Data Integration

No unified integration existed across airlines, ERP, and internal systems, leaving finance and operations disconnected.

Manual Airline Operations

Airline report downloads, refund calculations, and reconciliation all ran on manual, Excel-dependent workflows.

Airline Logic Variability

Each airline carried its own authentication and refund rules, with no standardised logic applied across the ecosystem.

Wallet & Balance Blind Spot

No real-time monitoring of airline wallet balances left booking failures undetected until they happened.

Fragmented Reporting

Sales, GMV, and profitability metrics were reported separately, with no single view across business functions.

Infrastructure Not Scalable

Infrastructure wasn't optimised for scalable data pipelines or BI, capping growth as volumes increased.

The Solution:

A four-layer transformation, from raw data to real-time decisions

Sthiros delivered an end-to-end transformation combining data engineering, a multi-bot automation framework, financial reconciliation, and BI reporting, eliminating manual intervention across airline and finance workflows.

Airline wallet balances are now tracked in real time, refund logic runs automatically per airline, and every business function reports off one centralised data model.

What This Means

Alerts beat the empty wallet.

One bot per failure point, not one big fix.

Reactive reporting becomes real-time control.

Outcomes

10+

Bots deployed

Airline extraction, refund processing, monitoring, and alerts automated end-to-end.

60-80%

Manual effort reduced

200+ hours saved per month across airline, finance, and reporting workflows.

100%

Airline automation coverage

Report downloads and refund calculations fully automated across every airline.

10-15%

Operational cost reduction

Reduced dependency on manual teams across airline operations, reporting, and reconciliation.

Get in touch

Is your travel platform running on data, or on manual workarounds?
